

How would you like to increase the Power and Performance of your Seat / Skoda without changing your Car?

The TDI and Turbo Petrol range of engines from the Volkswagen Audi group are the most solid, durable and most reliable series of engines ever made.

Have you often wondered why there are several BHP versions of the exact same engine in the same range of car? For example both Seat and Skoda sell 1.9TDI cars with 90BHP, 105BHP, 110BHP, 130BHP and 150BHP although this performance comes out the same engine. The same can also be said with the other 2.0TDI range of engines.

The reason for this apart from one being priced a lot more than the other is simply an upgraded software version on the ECU (Engine Control Unit). What this means is that you can still have the power of the 150BHP model without changing the car even if yours is 90BHP to start with.

- ▶ At **Tune-tec** we can re-map, or in simpler terms reprogram certain variables in the ECU software so that the engine can perform to the capabilities it was built for. All this is done safely and within the scope of the car and more importantly without invalidating or affecting the manufacturer's warranty.
- ▶ Below are some examples of typical performance gains you can achieve from some of Seat / Skoda's most popular cars:

<i>Make</i>	<i>Engine</i>	<i>Model</i>	<i>Increase</i>
<i>Seat Ibiza</i>	1.9TDI	130BHP	up to 180BHP
<i>Seat Leon</i>	1.9TDI	150BHP	up to 195BHP
<i>Skoda Octavia</i>	1.9TDI	130BHP	up to 180BHP
<i>Skoda Superb</i>	2.5TDI V6	155BHP	up to 200BHP

Even if your car is not listed in these examples we can still tune all TDI and Turbo Petrol cars to increase BHP and torque up to 45%
